

Career Track Analysis with SQL and Tableau Project

Case Description

- One of the functionalities the 365 company introduced in a 2021 platform release included the option for student enrollment in a career track. The tracks represent an ordinal sequence of courses that eventually lead to obtaining the skills for one of three job titles: Data Scientist, Data Analyst, or Business Analyst.
- Completing a career track is a challenging task. To acquire a corresponding career certificate, a student must pass nine course exams (seven compulsory and two elective courses) and sit for a career track exam encompassing topics from all seven required courses.
- This project analyzes career track enrollments and achievements of 365's students. Data is first retrieved from a MySQL database using SQL, then visualized in Tableau, and finally interpreted to generate business insights.

Featured Tools

- MySQL Workbench 8.0
- Tableau

Project Content

1. Extracting the data with SQL
2. Creating a Bar Chart in Tableau
3. Interpreting the Results

Project Summary

This end-to-end analytics project demonstrates how SQL and Tableau can be combined to analyze educational data. SQL is used to clean and retrieve relevant information, while Tableau transforms the extracted data into interactive visualizations. The final stage focuses on interpreting trends and presenting actionable insights regarding student enrollment and career-track completion.
